

# Setting Up Facebook

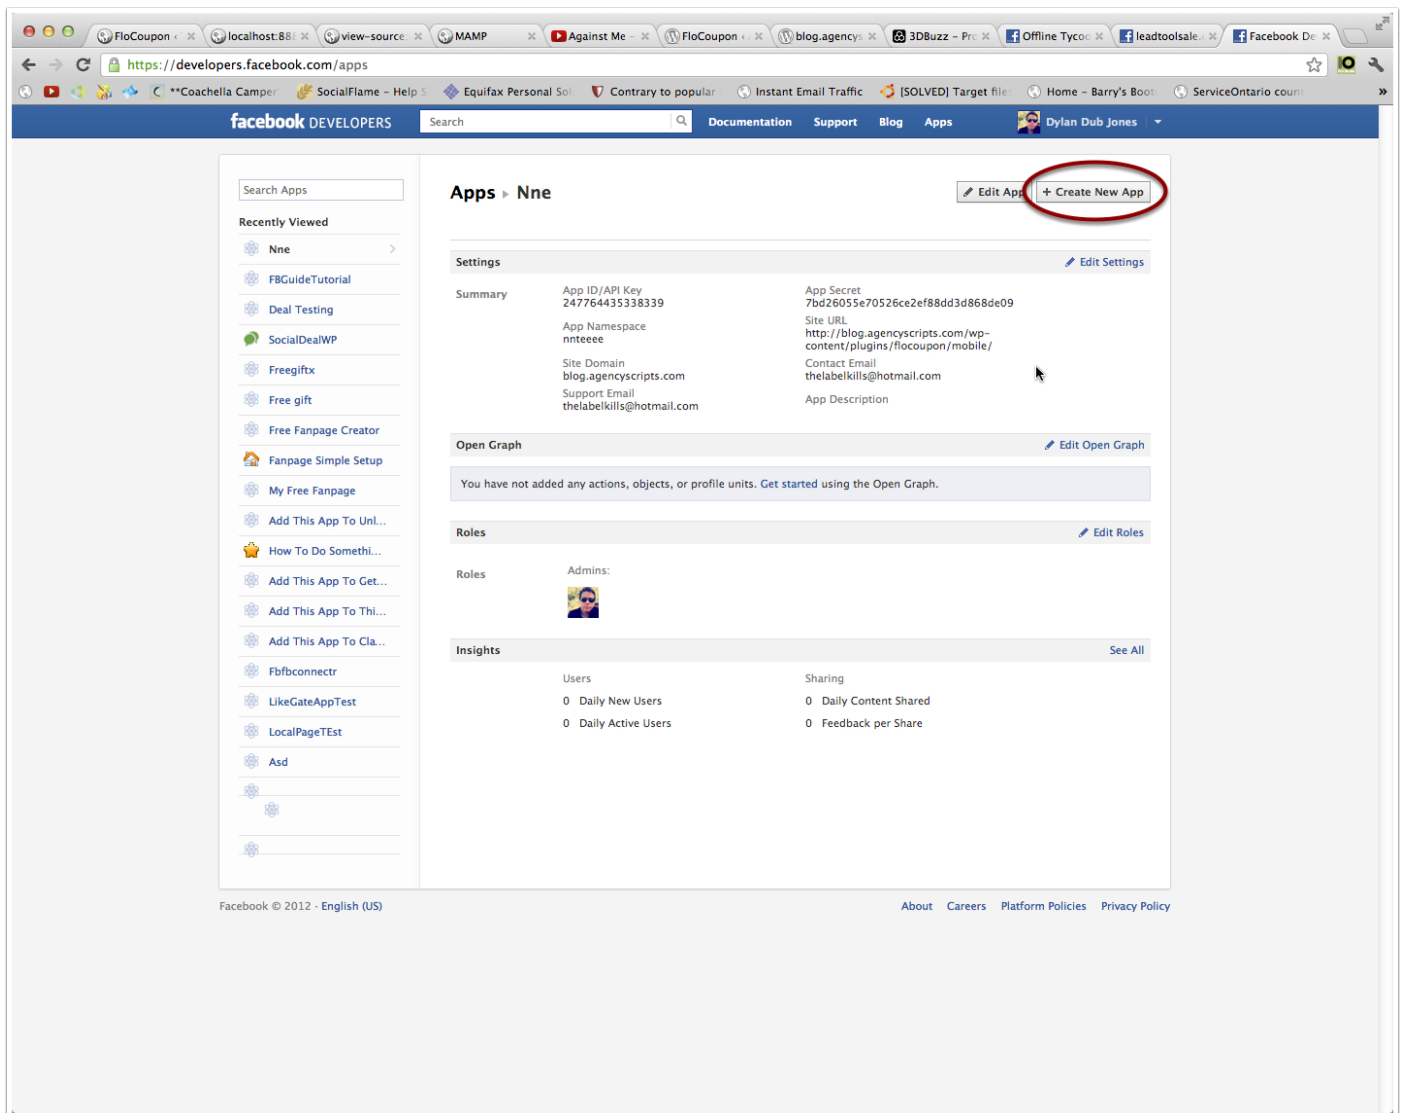

## Sign Up As A Facebook Developer

First, you will need to sign up as a facebook developer. Go to **developers.facebook.com** and sign up. They will ask you to verify your account through a txt message or a credit card (but it is free!)

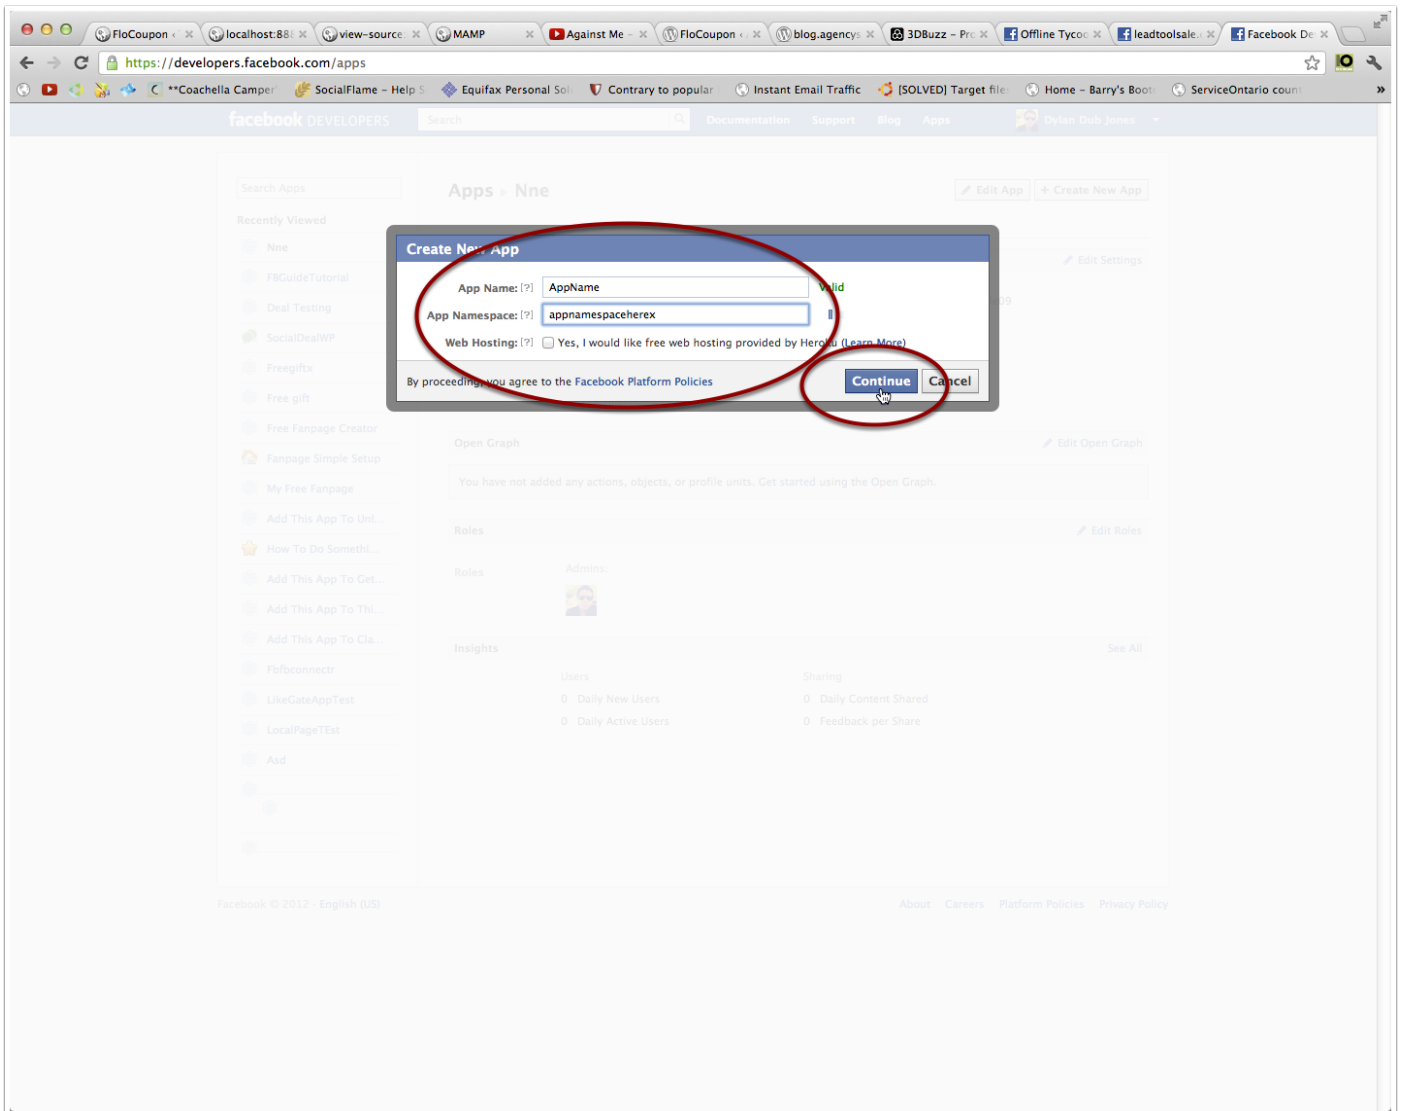

# Create a New App

Now you will need to click on the button called "Create New App" so you can go through the process of creating your new Facebook app...

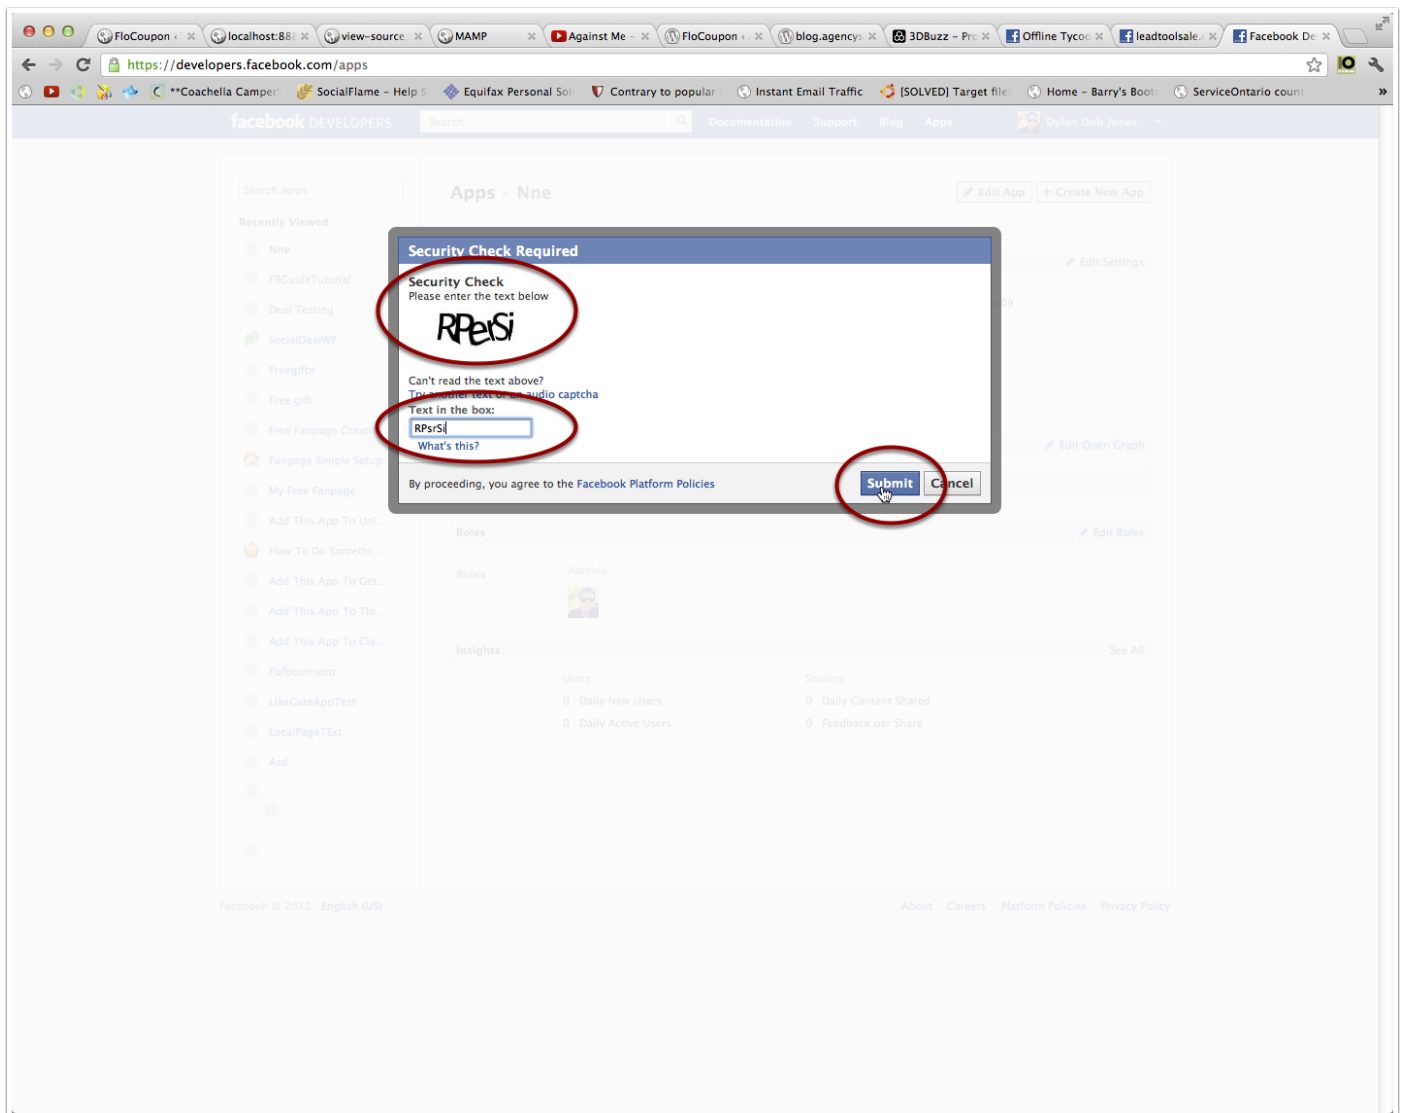

# Creating App Part 1

You now be prompted with a pop up asking for your App Name and App Namespace. They should be unique and they can be the same thing if you wish... then click continue...

## Creating App Part 2

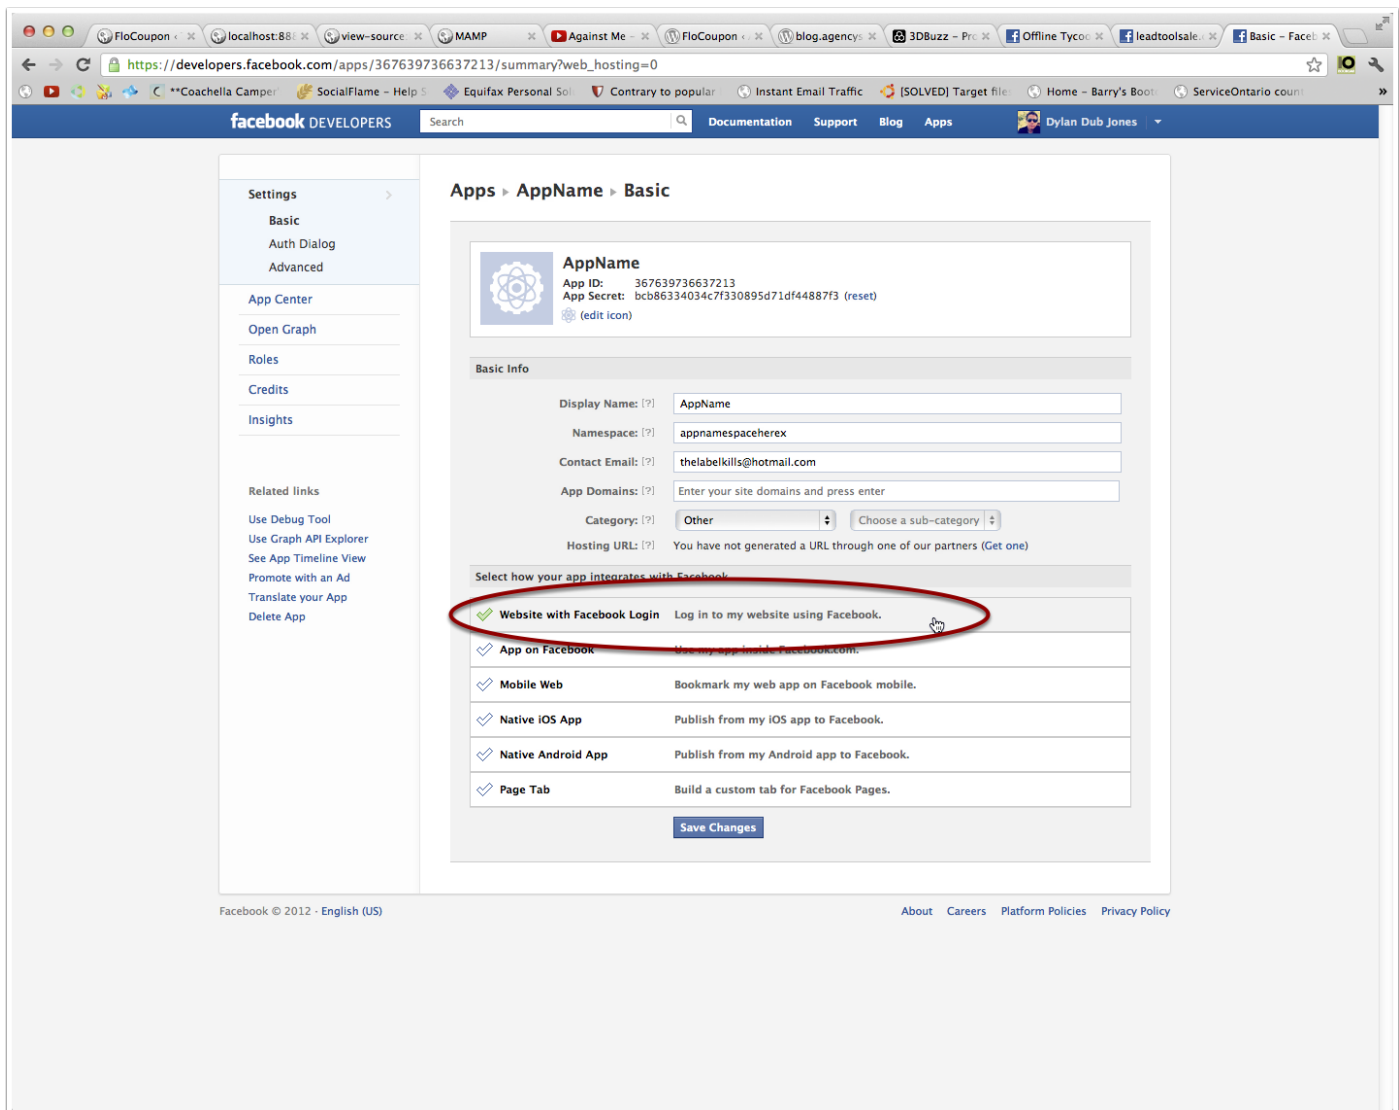

You will be required to prove that you are a human with a simple captcha message... annoying, but its not that bad!

# App Setup Part 1

Now that your app is created, you will now see the app edit screen.

First you will need to click "**Website With Facebook Login**", like the photo below...

## App Setup Part 2

You will need to associate your domain name with your Facebook app.

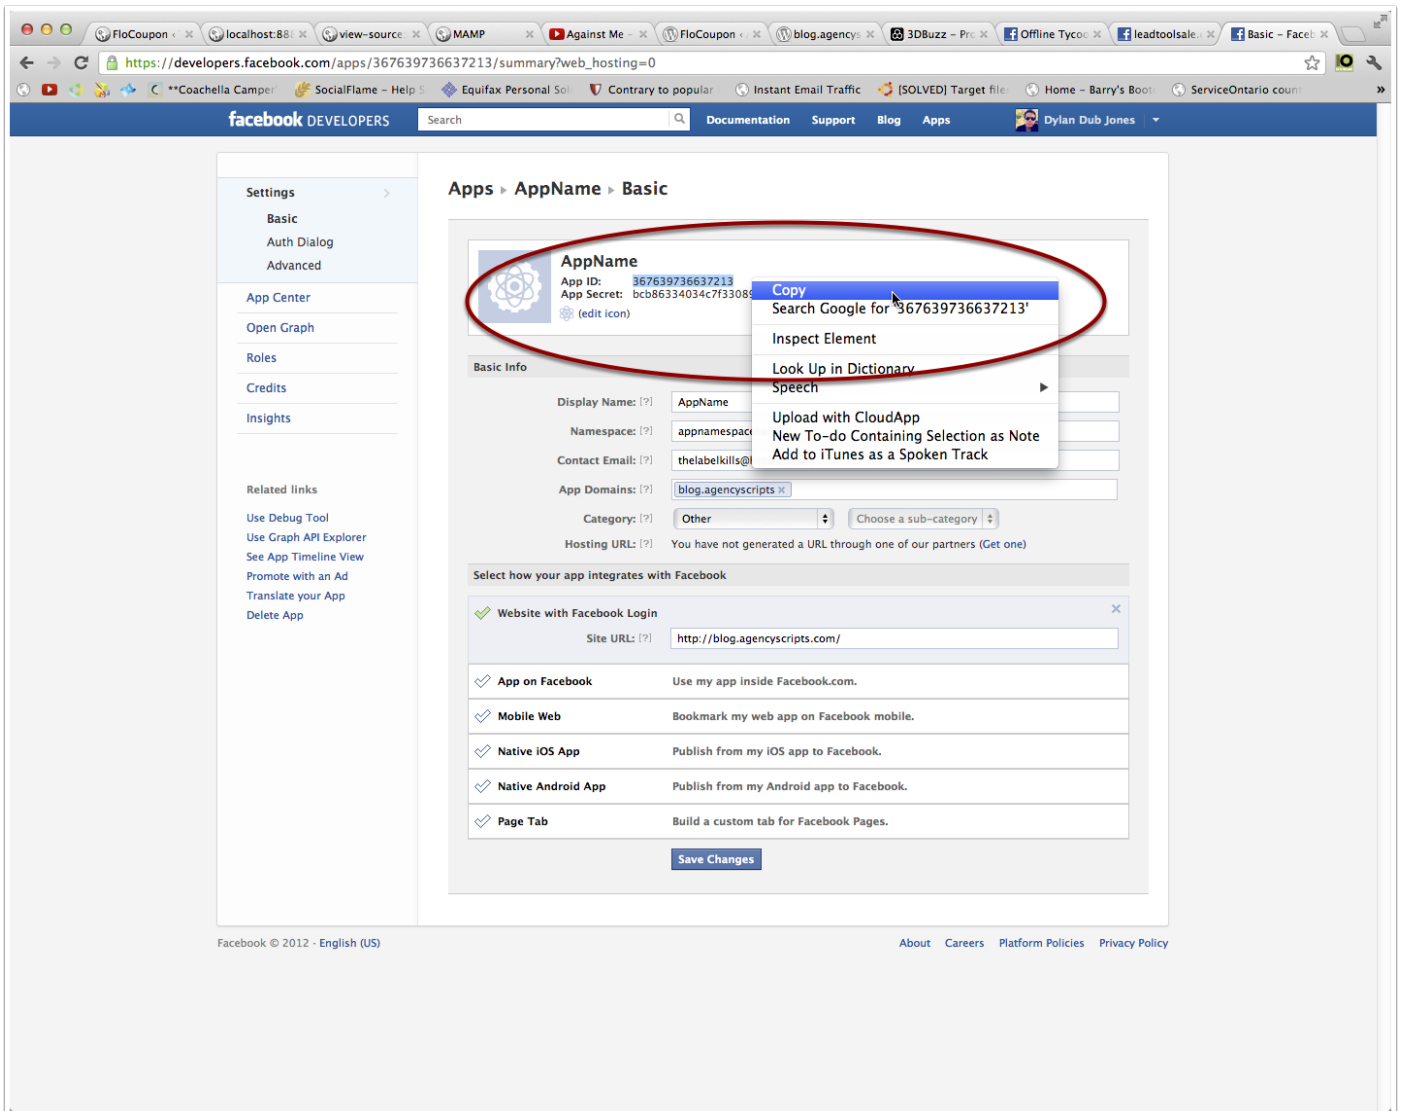

1.) This is your Site URL, so you will need to enter in the root of your site, or where you want people to go if they find this app on Facebook. I usually just put the root of my site, ie. `blog.agencyscripts.com`

2.) You will need to add your site domain here. If your site is "mysite.com" you will need to add "mysite.com" then press enter. It will then be highlighted like below. Do not add `http://`, just the name of your domain and press enter.

The screenshot shows the Facebook Developers interface for setting up a new app named 'AppName'. The browser address bar shows the URL: `https://developers.facebook.com/apps/367639736637213/summary?web_hosting=0`. The page has a left sidebar with navigation links: Settings (Basic, Auth Dialog, Advanced), App Center, Open Graph, Roles, Credits, Insights, and Related links (Use Debug Tool, Use Graph API Explorer, See App Timeline View, Promote with an Ad, Translate your App, Delete App). The main content area is titled 'Apps > AppName > Basic'. It displays the app's ID (367639736637213) and secret (bcb86334034c7f330895d71df44887f3). Under 'Basic Info', there are fields for Display Name (AppName), Namespace (appnamespaceherex), Contact Email (thelabelkills@hotmail.com), App Domains (blog.agencyscripts.com), Category (Other), and Hosting URL. A '2' in a circle highlights the App Domains field. Below this, a section titled 'Select how your app integrates with Facebook' shows several options: 'Website with Facebook Login' (checked), 'App on Facebook', 'Mobile Web', 'Native iOS App', 'Native Android App', and 'Page Tab'. The 'Website with Facebook Login' option has a 'Site URL' field containing 'http://blog.agencyscripts.com/' and a '1' in a circle. A 'Save Changes' button is at the bottom of the integration section. The footer shows 'Facebook © 2012 - English (US)' and links for About, Careers, Platform Policies, and Privacy Policy.

# Getting Your App ID

You will now need to grab your Facebook **App ID** and put it inside of the WP Plugin. The Facebook **App ID** is at the top of the page, as you can see below...

The screenshot shows the Facebook Developers 'Apps > AppName > Basic' page. A red circle highlights the 'App ID' field, which contains the value '367639736637213'. A context menu is open over the App ID, showing options like 'Copy', 'Search Google for...', 'Inspect Element', 'Look Up in Dictionary', 'Speech', 'Upload with CloudApp', 'New To-do Containing Selection as Note', and 'Add to iTunes as a Spoken Track'. The 'Basic Info' section includes fields for Display Name, Namespace, Contact Email, App Domains, Category, and Hosting URL. The 'Select how your app integrates with Facebook' section shows options for Website with Facebook Login, App on Facebook, Mobile Web, Native iOS App, Native Android App, and Page Tab. The 'Save Changes' button is at the bottom of the integration section.

facebook DEVELOPERS

Apps > AppName > Basic

AppName

App ID: 367639736637213

App Secret: bcb86334034c7f33086
